So an angle that forms a linear pair will be an angle that is adjacent, where the two outer rays combined will form a line. So for example, if you combine angle DGF, which is this angle, and angle DGC, then their two outer rays form this entire line right over here. So we could say angle DGC.

Since angles $m\angle JML$ and $m\angle LMN$ form a straight line, the sum of the measures of the angles is 180° . $m\angle JML$ and $m\angle LMN$ are supplementary angles. Step 2 : Write and solve an equation to find x . The sum of the measures of supplementary angles is 180° . $m\angle JML + m\angle LMN = 180^\circ$ $3x + 54^\circ = 180^\circ$ Subtract 54° from each side. $3x = 126^\circ$
