## **Diagnosis and Management of Chronic Aortic Regurgitation ...**

Aortic regurgitation (AR, also termed aortic insufficiency) results in diastolic blood flow from the aorta back into the left ventricle (LV) and may be caused by a variety of acquired or congenital aetiologies preventing complete coaptation of the aortic valve (AV) leaflets (also called cusps) (Table 1).

Aortic valve regurgitation occurs when the aortic valve one of the four valves in the heart fails to function properly and allows blood to flow backward through it. When some blood flows back from the aorta into the heart, it puts pressure on the heart and decreases the amount of blood flowing to the rest of the body.

Aortic insufficiency (AI), also known as aortic regurgitation (AR), is the leaking of the aortic valve of the heart that causes blood to flow in the reverse direction during ventricular diastole, from the aorta into the left ventricle. As a consequence, the cardiac muscle is forced to work harder than normal.
