## **Device Driver Reference Unix Svr 4 2**

The device driver-model tracks all of the drivers known to the system. The main reason for this tracking is to enable the driver core to match up drivers with new devices. Once drivers are known objects within the system, however, a number of other

things become possible.

## **Device drivers infrastructure — The Linux Kernel documentation**

The Linux kernel remains a large and complex body of code, however, and would-be kernel hackers need an entry point where they can approach the code without being overwhelmed by complexity. Often, device drivers provide that gateway. Device drivers take on a special role in the Linux kernel.

### **1. An Introduction to Device Drivers - Linux Device ...**

The iface argument points to a usb\_interface structure which is part of the usb\_config\_descriptor which is accesible from the usb\_device structure (given in the probe function). The drv\_context pointer normally references the device driver's context structure (see return value of the probe function).

A driver can use the lock to track outstanding I/O on a device and to determine when the driver can delete its device object in response to an IRP\_MN\_REMOVE\_DEVICE request. IoAcquireRemoveLock Increments the count for a remove lock, indicating that the associated device object should not be detached from the device stack nor deleted.

## **Windows kernel - Windows drivers | Microsoft Docs**

All drivers follow a relatively consistent implementation model, given the differences among peripheral devices and the differing functionality required of bus, function, filter, and file system drivers. Like the operating system itself, drivers are object-based. Drivers, their devices, and system hardware are

represented as objects.
