tend to show a reduction in cusp and  
root number. [8]

### **Hominid dental morphology evolution - Wikipedia**

The difference between these types of teeth will be described in the next section. The crown is the part of the tooth that is visible in the oral cavity. The crowns of anterior teeth have four surfaces and one ridge, while posterior teeth only have surfaces (see Figure 5). The surface of a tooth that is facing an adjacent tooth is referred to as a proximal surface.

### **Tooth Morphology Overview | IntechOpen**

One-way analysis of variance (ANOVA) was used to compare the differences according to the types of teeth in statistical analysis, and the Tukey HSD test was used for post hoc testing ( $\alpha = 0.05$ ).

Diagram of primary teeth. The mandibular primary first molar has 4 cusps unlike the permanent mandibular molar which consists of 5 cusps. It has a prominent transverse ridge that divides the occlusal surface, it is unique in that it doesn't resemble any tooth in the whole dentition. The primary mandibular second molar consists of 4 cusps, and resembles the permanent mandibular first molar in shape but is smaller.
